

HoverDisk Force Balance

Sail thrust, gravity, and orbital centrifugal balance for an offset disk.

Conceptual meridional section; not to scale.

Current figure intent: thrust + gravity + centrifugal closure, with the same sum read as centripetal demand toward the offset-disk center.

How to read the balance

- F_{sail} solar-sail thrust
- F_g gravity toward the star
- F_{cf} centrifugal term from orbital motion
- F_c equivalent inward centripetal demand

Co-rotating view

$$F_{\text{sail}} + F_g + F_{\text{cf}} = 0$$

The three applied terms close as a static vector polygon.

Equivalent inertial view

$$F_{\text{sail}} + F_g = F_c$$

F_c points toward the offset-disk center and represents the required inward acceleration, not a separate actuator.

$$F_c = m \cdot \omega^2 \cdot \rho$$

Dashed auxiliary lines show vector addition and closure.
