

Support Continuum: From Keplerian to Radiation-Dominated

The full spectrum from pure orbital support ($\varphi=0$) to branch terminus ($\varphi\approx 35.3^\circ$)

Key Points

① Keplerian Limit

$\varphi = 0^\circ$
 $\beta = 0$ (no radiation support)
 $\nu = 1$ (pure orbital support)
Traditional Dyson Swarm regime

② Bubble/Statite Entry

$\varphi \approx 22.6^\circ$
 $\beta = 1$ (full levitation possible)
 $\nu \approx 0.64$ (still orbital)
Statite architecture becomes viable

③ Branch Terminus

$\varphi \approx 35.3^\circ$ ($= \alpha_{\text{opt}}$)
 $\beta = 1.5$
 $\nu = 0$ (no orbital support)
Payload-friendly branch ends here

— $\beta_{\min}(\varphi)$
— $\nu(\varphi)$
